

## **PCR test**

The DNA of the coronavirus is detected in the PCR test. It is considered to be the safest test method for infectious diseases.

As with the quick test, the sample is taken with a cotton swab from the mouth, nose and throat. The same applies here: It may be an unfamiliar feeling, but the procedure remains painless and injury-free.

Until now, the evaluation of PCR tests took a few hours, sometimes even days, and time-consuming laboratory work. In our AC med Corona test center, however, we work with a state-of-the-art system from the market leader, the technical adaptation of which to the current requirements was funded by the Federal Ministry of Education and Research. The device is installed directly on our premises and the sample is effortlessly checked automatically.

In this way, we can send you the test result after 45 minutes, similar to the quick test procedure, as a text document and without detours.
